

matter of just what does the Bible teach about them, and there has been much controversy on that, and I'm not interested in presenting the theories on it, but just what I think I find definitely in the Word of God, and that of course we could easily spend several hours on, but I would like to present what I think are the main, clear matters connected with ~~the~~ the Word of God in connection with this, and if you would like to have questions or discussion on certain phases of this, we can give what-ever length of time you would care to it. That would be the second aspect. ~~ok~~ The third aspect is one which is less known--I knew very little about five years ago, but which I think is tremendously important; and that is, how evolution came into our modern world. Just exactly who was Darwin, what did he do, what were the causes that led to the evolutionary theory spreading the way that it ~~it~~ did, and I have a number of extremely interesting matters in that connection that I think would be valuable for you to know something about. Of course in that/this afternoon more than a tiny fraction of what there is in it, ... and then go as far as time will permit. ... How much scientific evidence is there for the evolutionary theory, and in connection with that, there are a few matters I ~~can't~~ think are tremendously interesting that I would like to mention, but beyond them I would not feel qualified. So those are the three aspects, and I mention that so you will have an idea of just how much time we ~~out~~ ought to give to the three, but I feel that the second is the one most vital to us, the matter of the scripture.

Maybe I'll take a couple of minutes in introducing that though to give you some-

thing that I ~~came~~ came across that I thought was very interesting. This little book, "The Nature of the Universe," by Fred Hoyle (MS) ^{Hoyle (11-10) Now, Fred H. is an} believes that the universe (on back)

came into existence about 4,000,000,000 years ago and that at that time there

was suddenly what they call a big bang ^{Suddenly all the matter in the universe came together into something the size of a football} and ~~and~~ ^{but it was there according to}

~~they call it the Big Bang Theory~~ ^{how it all got there or where it came from is a diff. question}
