

molecule as an opening four miles wide would appear to a human being! Think ~~now~~ of the infinite smallness, the infinite detail of this universe that God has created. It simply staggers the imagination. "In the beginning God."

Certainly one of the most wonderful things God has made is the human body. In one ordinary brain, I'm told there are three or four times as many cells as there are people on the whole earth. Every one of these cells has within it the ability to determine all the qualities of that person's ^{physic} and many of the qualities of his mental attitude. In every one of these and three or four times as many as the whole number of people on this earth. What a tremendous universe God has made.

Yet how blind many people are! It was not many years ago when a professor from Harvard gave a talk on evolution at the Academy of Natural Science in Philadelphia. One of my friends ⁱⁿ heard him. I myself had read/one of his books the same illustration with which he began his talk that day.

He said, Now I know there are some who think it takes a spirit to make all these things. That they don't just happen by the law of causality. But, he said, If you want to believe that in my auto there is a little imp under the hood that makes the car go, there is no way I can prove you are wrong. But I happen to know enough about the explosive power of gasoline and about the ability of a electric spark to ignite it to think that I have something of an understanding of what it is that really makes the car go."The people there, I am told, smiled and looked, Of course, of course that's right." How silly. Who made the automobile? Did it come into existence by accident? Did not some mine ^{far} smaller, far less than the mind of God, as small compared to
