

bang when everything was together in one ball and exploded, are so easily recognized as they rebound through space, he says, that it is quite obvious that there must have been such a thing. He says this theory which was advanced in 1948, practically all astronomers have now given up because they have no way to account for the creation of new material to replace the galaxies which are moving further and further away from us. So that today the steady state theory which was widely accepted 20 years ago, according to Seagan is practically given up and they all recognize that there is a big bang at that time, at some time way in the past from which everything in our present situation started.

Well then what will he do? There are those now who say, Everything is now going out. It is like a ball. If you throw it in the air it will come back. Therefore they say this will be condensed and come together again in one big fiery explosion and all the matter in the universe will be compressed into a small space and again there will be a big explosion and that's what has been going on back and back as far as you can go. That is the attempt to get away from the idea of creation.

But Prof. Seagan says in his book, Attempts are being made to find evidence that the amount of material in the air, the mass of material is sufficient to produce that reversal and cause the everything to stop from going out and to come together again. He says all the results up to the present are negative. Therefore, he says, it appears to most astronomers today most likely that the present process of going out and out and out will simply continue until everything gets beyond the range of everything else and everything dies in coldness and darkness! He does not say what that does to this theory of this ~~process~~ process of coming together & going out.
