

So they say there must be a Creator and it must be that some small living thing started on some other planet and drifted into this planet. That's how we got life here! All those who want to deny God will go to any absurd lengths in order to try to keep us from believing that there is a Creator. Scripture says, He that sitteth in the heavens shall laugh, He shall have them in derision.

Incidentally let me say this, The number of people from Christian backgrounds who lose their faith in unbelieving schools and unbelieving universities today is very very great. But the number who lose their faith because there is presented to them reasonable evidence that convinces them is very very small! He that sitteth in the heavens shall have them in derision, but there's nothing worse we hate than to be derided or looked upon as being a little foolish. You let a professor who knows a lot more than we do (you do) simply say, Well, if you want to believe some fool thing like that, why of course that's up to you. That will turn more people away from Christian faith than any kind of argument you can have.

I imagined once I had an interesting dream. I love to walk in the woods, in the mountains. In this imaginary dream I would be with a friend, an atheist friend. We walked together through the woods, and we came to a little clearing in the woods. In the middle of it there was a log cabin standing. I said, to my friend, It's interesting to imagine just how things happened. Here is this cabin, I wish we could understand the forces. Whether a great storm, a tremendous wind caused all these trees to fall over and to fall over in just a way as to cause the logs to fall one on top of the other and make the four walls of the cabin, and was it lightening or something that cut off the ends of them so the ends are just even!

You look at those windows! Glass isn't just found naturally in nature anywhere that we know. What kind of force was it that brought out of the earth these various metals and put them under the right heat and fused them together to make glass? How did the glass get into just the right shape to fit in the little space which has somehow come in the side of the log cabin so as to make those windows? Look, I see smoke coming out of the top. There is a fire in there! Is that going to burn down now? No, there is some iron in there. An iron stove, and the smoke is going out the chimney. How did that iron get out of the ground and get formed into shape to make a stove? Oh, if we could just understand the forces that work together to produce this by accident. And he would say to me, What kind of fool do you think I am? Those things didn't happen just by accident! Of course some man planned it. Some man cut down the trees. Some man took the various elements and made the glass. Some man cut the spaces and cut the glass just the right shape and put it in there. It's perfectly obvious that some intelligent being planned it and put it together. And I said, You're right! I would think you were a fool if you thought that
