

All of this being perfectly natural and mechanical. However, as he walks through the woods, if he comes to a little cabin, and sees, he may come to a little cabin. There he sees windows through which as he comes close to them he can look into the inside of the cabin. Inside of it there is a stove and a chimney going up from the stove and from the top of it the smoke is coming out. If someone were to tell him that by a purely natural process the trees had fallen in such a way that the logs fell one on top of another, and made the sides of the house, the glass by a natural process came to fill the exact shape of the windows, and to do it so evenly that it could be seen through. Metal had landed accidentally in the middle of the cabin in such a way that a fire could be built inside of it and a fire had naturally sprung up there and the smoke was coming out of the window at the top. If this statement were to be made the man who alleged it would immediately be laughed at. Anyone can see that it is perfectly obvious that a human mind has been busy here, cutting down the timbers, fashioning them for walls, building the cabin, getting, melting the iron, arranging it in such a way as to make the stove and so forth.
