

Fig. 5. A fossil coral colony from a depth of 937 feet in one of the test wells drilled in Bikini atoll. This specimen shows seven of the "cups" in which the coral animals lived. The number "X 5.5" at the side means that the photographic process magnified the specimen five and one-half diameters. Seriatopora ornata. From J. W. Wells, "Fossil corals from Bikini drill holes, Bikini and nearby atolls," U. S. Geological Survey Professional Paper no. 260-P, 1954, Plate 223, Figure 4.
