

Fig. 15. Location and structure of the Trucial Coast, where extensive studies of modern evaporite formation and dolomitization have been made. In the larger figure, the coastal sabkha is a broad band along the coast, which lies just above the high-tide level. Redrawn from D. J. J. Kinsman, "Modes of formation, sedimentary associations, and diagnostic features of shallow-water and supratidal evaporites," American Association of Petroleum Geologists Bulletin, vol. 53, no. 4, 1969, Figure 2; and other sources.
